

Medical Complications of Eating Disorders
And Nutritional Remedies

Therese Shumaker M.S.,R.D.,L.D.

Objectives

- Develop an awareness and understanding of medical complications associated with anorexia , bulimia and diabulimia
- Become familiarized with standard assessments of potential medical complications
- Increase knowledge of inpatient and outpatient eating disorder treatment interventions in a multidisciplinary framework

What causes eating disorders?

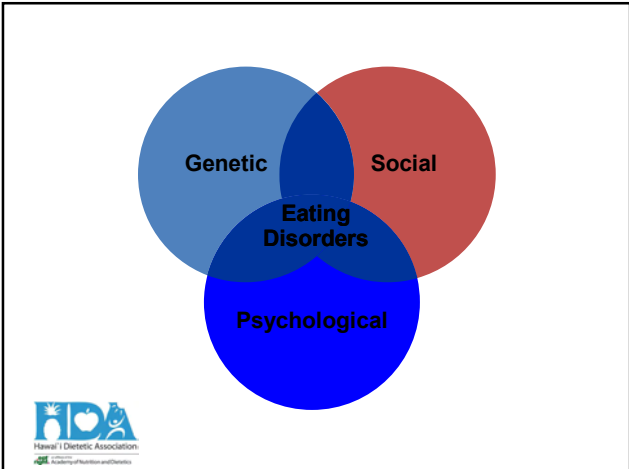

Genetics loads the gun.....

- body type
- temperament
- linkage on chromosomes
- gender

..environment pulls the trigger.

- life events
- media influence
- family dynamics

Types

- Anorexia
 - Early adolescents
 - Morbid dread of body fat
 - Refusal to maintain body weight
 - DSM changes (2013)
 - Perfectionist/OCD
- Bulimia
 - Later adolescents
 - Failed attempt at anorexia
 - Risk takers
 - Substance abuse
 - BPD

©2011 MEYER | 3128022-6

Eating Disorder Not Otherwise Specified

- Most prevalent
- Do not meet strict criteria
- Most common is BED
- Often rejected by insurance companies
- No less serious than AN or BN

©2011 MEYER | 3128022-6

BED and Obesity

- Central feature of BED relates to increasing BMI
- Binge Eating occurs in 20-40% of people who are overweight
- Goal : body acceptance
- Proposed to be in DSM V- 2013

©2011 MEYER | 3128022-6

Facts about Eating Disorders

- Majority of patients are not underweight and most are not seriously physically compromised
- Girls who diet are 12 times as likely to binge as girls who don't diet
- Almost always come as a 'package deal' with one or several comorbid psychiatric diagnoses
- Serve as strategies , or pseudo solutions to deal with a variety of personal conflicts and lack of control for life situations
- Often regarded as separate disorders

Hawaii Dietetic Association
 HAWAIIAN DIETITIAN SOCIETY
 ACADEMY OF NUTRITION AND DIETETICS

Medical Complications

- **Anorexia**
 - Direct result of starvation and weight loss
- **Bulimia**
 - Direct result of mode and frequency of purging
- **Prognosis**
 - Long duration of the illness
 - Less favorable outcome
 - Suicide or cardiac deaths
- **Prognosis**
 - Serious complications more likely to occur
 - Higher risk of suicide
 - Poor prognosis with substance abuse, personality disorders

Hawaii Dietetic Association
 HAWAIIAN DIETITIAN SOCIETY
 ACADEMY OF NUTRITION AND DIETETICS

Anorexia in Males

- Morbid fear of becoming fat
- Males diet for different reasons
 - Changing body shape
 - Better sports performance
- Homosexual men have a higher risk

Hawaii Dietetic Association
 HAWAIIAN DIETITIAN SOCIETY
 ACADEMY OF NUTRITION AND DIETETICS

Admission vitals

- Wt: 62 pounds (< 3% CDC growth chart)
- Ht: 157 cm (< 3% CDC growth chart)
- BMI 11.6
- Potassium 5.2
- Phosphorus 3.0
- Magnesium 2.4
- Tums 3000mg daily
- Repleting phos as needed – sodium phosphate

Refeeding Syndrome

- Enteral or parenteral route – refeed too quickly
- Hypophosphatemia, hypomagnesemia, hypocalcemia, and fluid retention
- Dangerous- “start low and go slow”
- 30Kcal/kg initial calories, no more than 250-300Kcal increase once per week
- Evaluate electrolytes at least three times per week

Lab trends

- Blood glucose: 73 mg/dL., Potassium: 4.5 mmol/L., Creatinine: 0.6 mg/dL., BUN: 15 mg/dL., Magnesium 2.1 mg/dl, total calcium 8.6mg/dl

- Phosphorus trends:

	Morning	Evening
Date:		
7/25	2.7 mg/dL	1.7 mg/dL
7/26	3.4 mg/dL	1.2 mg/dL
7/27	2.5 mg/dL	1.1 mg/dL

Osteoporosis and Anorexia

Psychological Approaches

- Individuals with eating disorders considered incapable of making choices
- Standard psychological therapies considered ineffective when brain is in a starvation state
- Initial focus on refeeding- **Food is Medicine**
- Requires help from caregivers, spouses, friends
 - Challenges
- Research suggests that use of SSRIs is not effective prior to weight restoration

©2011 MFAB | 3126022-19

Brain Effects of Starvation

- Keys' Minnesota Starvation Experiment (1944)
- Severe psychological distress
 - Depression
 - Anxiety
 - Irritability
 - Social isolation
 - Decreased concentration, comprehension, judgment
- Increased food preoccupation

©2011 MFAB | 3126022-20

Minnesota Starvation Experiment (cont.)

- Humans become more oriented toward food during starvation state (and less driven by other pursuits)
- Did not become obese after study
- Need for very high calorie intake to begin weight gain

©2011 HDA | 5126022.21

Nutritional Interventions for Anorexia

- Focus on foods that do not promote satiety
- Food planning not calorie counting
- Vegetarian food patterns are common
- Nutrient dense foods not calories
- Small frequent feedings to reduce the sensation of bloating

©2011 HDA | 5126022.22

Rule of 3s

- 3 meals per day
- 3 snacks per day
- 3 ounces of protein (2x per day)
- 3 servings of calcium (1500 mg)

Common GI complaints in AN

- Gastroparesis
 - Bloating , feeling overly full
 - Improves once weight restoration begins – often takes 4-6 weeks
- Interventions
 - Using liquid supplements as ½ of calories
 - Taking liquids earlier in the meal , results in less bloating

Constipation

- Reassure patients that there is nothing wrong with their bowels
- Bowel patterns vary
- Interventions
 - Adequate fluid intake
 - Fiber in low doses

Laxative abuse

- Bowel becomes dependent upon laxatives
- Cessation of use causes rebound constipation and fluid retention
- Dilated colon, incapable of passing fecal material
- Laxatives are an ineffective means of achieving weight loss
- Avoid stimulant laxatives that contain senna, cascara, or bisacodyl(Dulcolax) – potential for dependence

Sponge Analogy

Resting Energy Expenditure

- Indirect calorimetry – measures heat production
- Measures a persons oxygen consumption and carbon dioxide production
- Can provide an estimate of substrate utilization based on the ratio of carbon dioxide produced to oxygen consumed (respiratory quotient RQ)

©2011 NPAPER | 312602-28

Special Pulmonary Evaluation Laboratory
Division of Pulmonary, Critical Care and Internal Medicine
Mayo Clinic - Rochester, Minnesota

Resting Energy Expenditure (REE)
INDIRECT CALORIMETRY ASSESSMENT

Procedure Time: 09:00 Date: 4/8/2011

23 y.o. Female Height: 154 cm Wt: 42.5 kg BMI: 17.92 BSA: 1.36

	Measured Value	Predicted	% Predicted
V _O 2 (ml/min)	136		
Respiratory Quotient (RQ)	0.78		
REE (kcal/24 hours)	938	1235	76
Temp (°C)	36.1		
Heart Rate	55		
O ₂ Saturation (SpO ₂)	99		
Respiratory Rate	16		

Comments
Steady state achieved.

©2011 MP/ER | 3126022-30

Interpreting RQ

- The range is from .7 -1.0
- If the value is under .7 prolonged starvation
- If the value is over 1.0 excessive calorie consumption

Energy source/condition RQ

- Prolonged ketosis <0.70
- Fat 0.70
- Underfeeding <0.71
- Protein 0.80
- Mixed energy 0.85
- Carbohydrate 1.00
- Fat storage >1.00

©2011 MP/ER | 3126022-30

Weight Restoration

- Goal is to achieve 90-100% IBW
- Increase calories by 300-400 every 3-4 days until adequate rate of weight is being restored
- Rate of weight gain: 1-1.5 lbs/week (outpt) and 2-3 lbs/week (inpt)

©2011 MP/ER | 3126022-31

Medical Complications of BN

Gastrointestinal	Endocrine
Dental Erosion	Irregular menses
Parotid Gland Swelling	
Esophageal Rupture	Metabolic
Reflux	Hypokalemia
Constipation due to laxative abuse	Dehydration
Mallory-Weiss tear	Nephropathy
Cardiac	Pulmonary
Arrhythmias	Aspiration Pneumonitis
Diet Pill toxicity, hypertension	
Cardiomyopathy-Ipecac induced	
Dermatologic	
Russell's sign	

©2011 MP/ER | 3126022-32

Hypokalemia

- Found in 1/3 of all patients with EDO in the hospital
- Result of chronic purging
- Laxatives – potassium loss in the stool
- Diuretics
 - Ammonium chloride
 - Thiazides

©2011 HPA/ERS | 3128022-33

Food Records/Clue Sheets Help Identify

- Patterns of irregular eating
- Triggers of restricting, binges, and purges
 - Thoughts
 - Situations
 - EDO behaviors
- Set specific goals to normalize eating
- Increases self-awareness

Time	Food/Drink	Thoughts	Situations	EDO Behaviors
7:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
8:00	Soda	Thought: I'm hungry.	Situation: In class.	Binge
9:00	Yogurt	Thought: I need to eat something.	Situation: Alone in room.	Restricting
10:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
11:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
12:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
1:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
2:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
3:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
4:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
5:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
6:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
7:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
8:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
9:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
10:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
11:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting
12:00	Apple	Thought: I need to eat something.	Situation: Alone in room.	Restricting

©2011 HPA/ERS | 3128022-34

Meal Planning for Bulimia

- Small frequent meals
- Small to provide comfortable volume
- Frequent to prevent binging every 4-6 hours
- Include protein and carbs at each meal

©2011 HPA/ERS | 3128022-35

Meal Planning for Bulimia

- Patients feel restricting is essential to weight loss – encourage regular eating
- Wait 30 minutes after meal to purge
- Encourage a calm eating environment, any stress can result in bingeing/purging
- A structured meal plan can help do not include foods pt is unwilling to eat or able to keep down
- Carbonated beverages should be limited

©2011 HPA/ERS | 3128022-36

Terry Schiavo

- Nations longest right to die case
- Desperately wanted to be thin
- Stopped menstruating and went to seek medical help
- No complete medical history taken
- Heart stopped due to a potassium imbalance – bulimia
- Malpractice lawsuit was filed – “medical negligence”

Diabulimia

- This struggle to maintain control can become the introduction to developing an eating disorder for a diabetic
- This issue of control is of special importance for adolescent diabetics.
- Mortality rate – 3 times as high
- Nearly 7% of youth with AN or BN are diabetic

©2011 NFAER | 3126022-28

AHEAD survey

- Screens for disordered eating behaviors and Type I diabetes
 - Out of 143 adolescents with type I diabetes
 - Nearly 40 % females and 16% males engaged in unhealthy weight control practices
 - Of the females, nearly 18% skipped or reduced insulin to control weight

Mollie

- 14 year old female, Caucasian
- Diagnosed with Diabetes at age 4- insulin pump
- Family characteristics
- Presentation to Psych

©2011 NFAER | 3126022-40

TIGHT...
Expectations
Perceptions
Under..
Out of..

"Under control"
can lead to

"Out of control"

Time line

- age 17 -admitted for inpatient treatment of eating disorder symptomology
- Cutting
- Concerned with appearance, wanting to lose weight
- Binging and purging, using laxatives
- Restricting her insulin dosing
- Depressive symptoms, thoughts of suicide

Time line

- Only one visit with the RD, not motivated to follow through on any recommendations
- Endo visit- A1c – 12%, hope that with EDO treatment she may become more motivated to control her diabetes
- Psych visit – eating disorder out of control- admitted to 2nd EDO treatment

©2011 NPAER | 312622-44

Subsequent visits

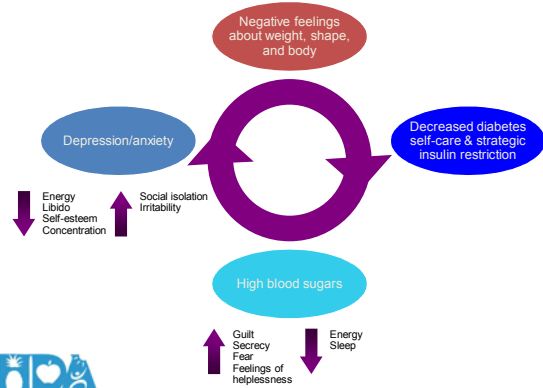

- Quit seeing the RD – does not feel it is helpful
- Off of the insulin pump and now taking injections
- A1c – 11.8%
- Numerous ER visits for elevated BS 571
- DKA
- Left AMA

©2011 HDA/ADA | 112802245

©2011 HDA/ADA | 112802245

Eating Disorder?

- Fluctuating blood sugars
- Frequent Hypoglycemia
- Frequent Hyperglycemia
- High hemoglobin A1C
- Increase in insulin adjustments
- Hypokalemia
- Hyponatremia
- Decline or stall linear growth
- Preoccupation with food /weight
- Labs may be normal

What works?

- Find out what motivates the individual-social
- Physical- height
- College admission
- Muscle mass
- Pregnancy
- Empowerment

Family Therapy

“When families reject psychological treatment, recovery from diabulimia can be delayed”

- Family dynamics contribute significantly to eating disorders, the families way of perceiving and dealing with the maladaptive behavior may be counterproductive, and may reinforce it.
- Looking at individual issues without considering their relationships within the family system misses important etiologic and maintaining factors of dysfunctional behaviors

SCOFF Questionnaire

- Do you make yourself **Sick** because you feel uncomfortably full?
- Do you worry you have lost **Control** over how much you eat?
- Have you recently lost more than **One** stone (14 lb) in a 3-month period?
- Do you believe yourself to be **Fat** when others say you are too thin?
- Would you say that **Food** dominates your life?

- Eating disorders often lead to serious medical consequences that can be life threatening
- It is critical for patients to receive ongoing medical assessment and intervention, which should take precedent over nutritional and psychological interventions
- Due to the complexity of eating disorders, a multi-disciplinary approach is imperative, including psychologists, physicians and dietitians
